

Build a Stronger Plant. Preserve Yield Potential.

TERRAMAR foliar technology **improves nutrient uptake efficiency** and **enhances stress mitigation**, optimizing plant health and contributing to enhanced yield. The two technologies in TERRAMAR stimulate plant development, increase photosynthetic capacity and help the plant maintain more optimal physiological functioning, translating into more consistent plant performance across a broad range of growing environments.

GROWER BENEFITS

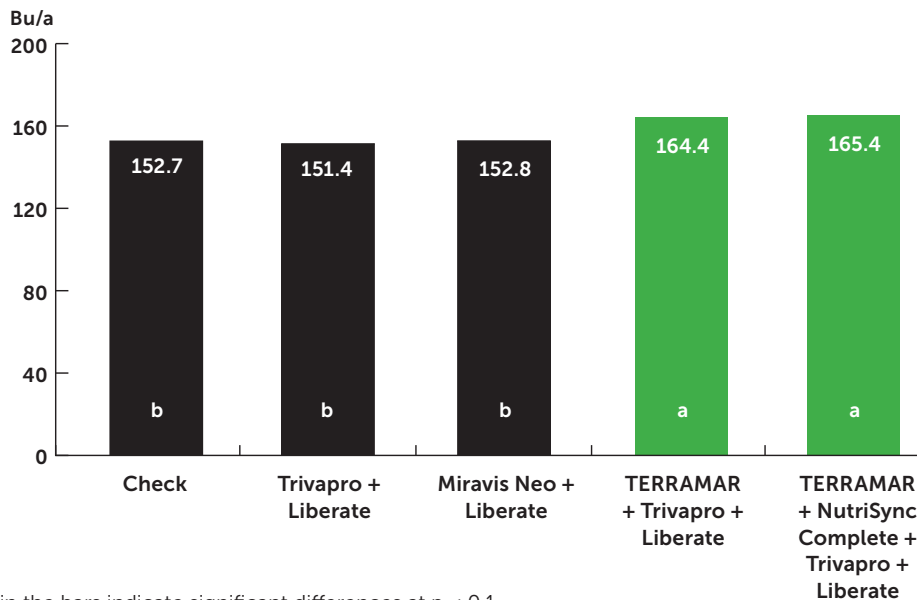

- **Builds** photosynthetic capacity resulting in a larger, more robust plant with increased sucrose storage
- **Preserves** plant sucrose reserves by improving physiological functioning → more sucrose available to fill grain (yield preservation)
- **Mitigates** the impact of weather-related stresses

PRODUCT FEATURES

- Foliar application delivers a unique set of highly active, metabolite-based compounds for quick absorption through the plant leaf tissue
- Compatible with key crop inputs, including liquid fertilizers, insecticides, herbicides and fungicides, for maximum application flexibility

Corn – North Carolina State University (2023)

TERRAMAR applied at 1 qt/acre at VT; Miravis Neo and Liberate each applied at 13.7 oz/ac; NutriSync Complete applied at 24 oz/ac

Note: Different letters in the bars indicate significant differences at p < 0.1.
